Hiring Manager
Electronic Arts

Dear Hiring Manager,

I am excited to apply for the Analytics Intern position with Electronic Arts in Orlando. I am pursuing a Bachelor of Science in Data Science at Florida Polytechnic University with a 3.85 GPA, and my background in Python, SQL, predictive modeling, customer retention, and data visualization aligns closely with EA's focus on using player behavior data to improve gameplay and engagement.

During my Data Analyst Internship with One Alliance North America Insurance, I developed an end-to-end policy retention prediction framework covering data research, ETL, feature engineering, model selection, tuning, and validation. Using Python and PyCaret, I built and tested models that helped identify approximately $500,000 in at-risk annual recurring revenue. I also worked directly with business teams to investigate data issues, test assumptions, interpret model results, and communicate findings in a way that supported decision-making.

My project work has strengthened my ability to turn data into meaningful improvements, especially around what keeps people satisfied and engaged. For my College Happiness Simulator, I asked what actually drives student happiness, beyond the prestige factors that traditional rankings emphasize. I scraped student ratings from RateMyProfessors and institutional data such as retention rates, tuition, and enrollment from NCES College Navigator, then cleaned and merged them into a dataset of about 3,000 universities with 27 features. To test hypotheses about what drives satisfaction, I compared Linear Regression, XGBoost, and Random Forest models. The Random Forest performed best ($R^2$ of 0.75, with consistent 5-fold cross-validation) and showed that career opportunities and campus facilities matter far more than amenities like food or clubs. I then built an interactive Streamlit simulator that lets a user pick a school and see which investments would produce the largest gains in student happiness. I'm excited to bring this same approach to player data: finding the gameplay behaviors tied to retention and engagement, and presenting them clearly to analysts, product managers, and game designers.

I am especially interested in the opportunity to analyze gameplay and player behavior across Madden and College Football. The chance to test hypotheses around retention and engagement, work closely with analysts and game designers, and carry an analytical project from problem definition through final presentation strongly matches the type of work I enjoy.

Thank you for considering my application. I would welcome the opportunity to contribute my analytical skills, curiosity, and experience to Electronic Arts.

Sincerely,

Will Mizer
